I am excited to share that I have successfully completed my Advanced Level Data Science Task as part of my learning experience with @ShadowFox.
During this task, I worked on building a structured performance analysis matrix using real match-based data.
The project involved:
• Data cleaning and organization
• Creating performance metrics based on defined scoring criteria
• Assigning weighted points for various performance indicators
• Calculating overall Performance Scores (PS)
• Applying logical and analytical thinking to interpret results
This task helped me strengthen my understanding of data analysis, scoring systems, structured datasets, and performance evaluation techniques using Excel.
Grateful to @ShadowFox for providing such a practical and skill-oriented learning opportunity that enhanced my analytical and problem-solving abilities.
Looking forward to applying these concepts in real-world data science projects.

As part of my Data Science learning journey at @Shadow Fox, I worked on an air quality analysis project focusing on PM2.5 pollution levels (January 2023 dataset).

🔍 Project Highlights:

• Data loading and preprocessing using Pandas
• Datetime conversion and feature extraction for time-based analysis
• Descriptive statistical analysis
• Time-series visualization of PM2.5 trends

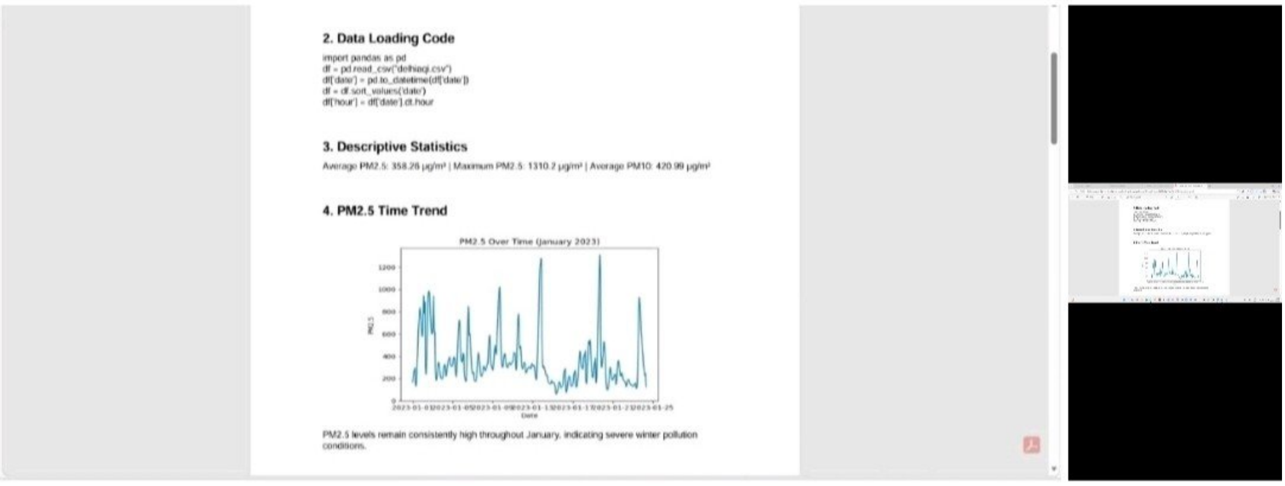
📊 Key Insights:

Average PM2.5: 358.26 μg/m³
Maximum PM2.5: 1310.2 μg/m³
Pollution levels remained consistently high throughout January, indicating severe winter pollution conditions.

This project enhanced my skills in: ✔ Data preprocessing
✔ Time-series analysis
✔ Data visualization
✔ Insight extraction from real-world datasets

Grateful to @Shadow Fox for providing the opportunity to work on practical Data Science projects and strengthen my analytical skills.

#DataScience #Python #DataAnalysis #ShadowFox #TimeSeries #BTechStudent #Learning



2. Data Loading Code

```
import pandas as pd
df = pd.read_csv("delhiaqi.csv")
df['date'] = pd.to_datetime(df['date'])
df = df.sort_values('date')
df['hour'] = df['date'].dt.hour
```

3. Descriptive Statistics

Average PM2.5: 358.26 µg/m³ | Maximum PM2.5: 1310.2 µg/m³ | Average PM10: 420.99 µg/m³

4. PM2.5 Time Trend

PM2.5 levels remain consistently high throughout January, indicating severe winter pollution conditions.

As part of my Data Science internship at Shadow Fox, I completed a detailed documentation on Python Visualization Libraries – Matplotlib & Seaborn.
This task focused on understanding:
• Matplotlib architecture (Figure & Axes)
• Core visualization techniques
• Customization and flexibility in plotting
• Seaborn for statistical data visualization
• Practical applications in data analysis
Through this assignment, I strengthened my understanding of data visualization fundamentals and improved my ability to present insights effectively.

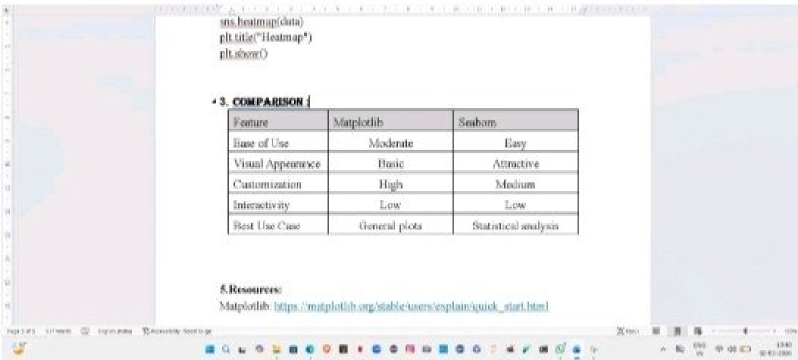
Visualization Library Documentation
Libraries: Matplotlib & Seaborn
Internship: Shadow Fox

1. MATPLOTLIB OVERVIEW
Matplotlib: The Foundation of Python Viz
Think of Matplotlib as the "grandfather" of all Python visualization. It's the most established library out there, and while it might feel a bit old-school compared to newer tools, it gives you total control over every single pixel on your chart. Whether you need a quick sketch of your data or a polished, high-resolution figure for a formal report, Matplotlib is the engine that makes it happen.
The reason it's so popular in data science is its flexibility. It works in layers: you start with a blank Figure (the canvas) and then add Axes (the actual plots) on top of it. Because it's built to work perfectly with NumPy and Pandas, you can take a massive spreadsheet and turn it into a clear visual



```
sns.heatmap(data)
plt.title("Heatmap")
plt.show()
```

3. COMPARISON :

Feature	Matplotlib	Seaborn
Ease of Use	Moderate	Easy
Visual Appearance	Basic	Attractive
Customization	High	Medium
Interactivity	Low	Low
Best Use Case	General plots	Statistical analysis

5.Resources:
Matplotlib: https://matplotlib.org/stable/users/explain/quick_start.html
